

# Translations API

---

## Overview

---

This is a Dockerized, API-only Ruby on Rails application with several endpoints to manage glossaries and translations.

**Features:**

- REST API using Grape.
- Tests using RSpec.
- PostgreSQL database.
- Swagger UI for API documentation and interaction.
- Dockerfile that helps to run the API.

## Installation

---

You can use Docker to install and run this application:

```
docker-compose build

# One time
docker-compose run web bash
rails db:create db:migrate
exit

# And then, to start the server each time
docker-compose up web
```

## Documentation

---

All endpoints available within this API are well documented. Swagger UI is set up to visualize and interact with the API's resources. To access Swagger UI you can go to:

```
http://localhost:3000/swagger
```

## Testing

---

All endpoints in this API have been tested using RSpec. To run all tests:

```
docker-compose run web bash
bundle exec rspec
```
